

On-line Tar Analysis with GC and Electron- / Laser-Ionization Mass Spectrometer

York Neubauer

Technische Universität Berlin / Berlin Institute of Technology

Department of Energy Engineering
Chair for Energy Process Technology and
Conversion Technologies for Renewable Energies (EVUR)
Fasanenstr. 89, D-10623 Berlin
york.neubauer@tu-berlin.de

1. Application of Laser ionization (LI)

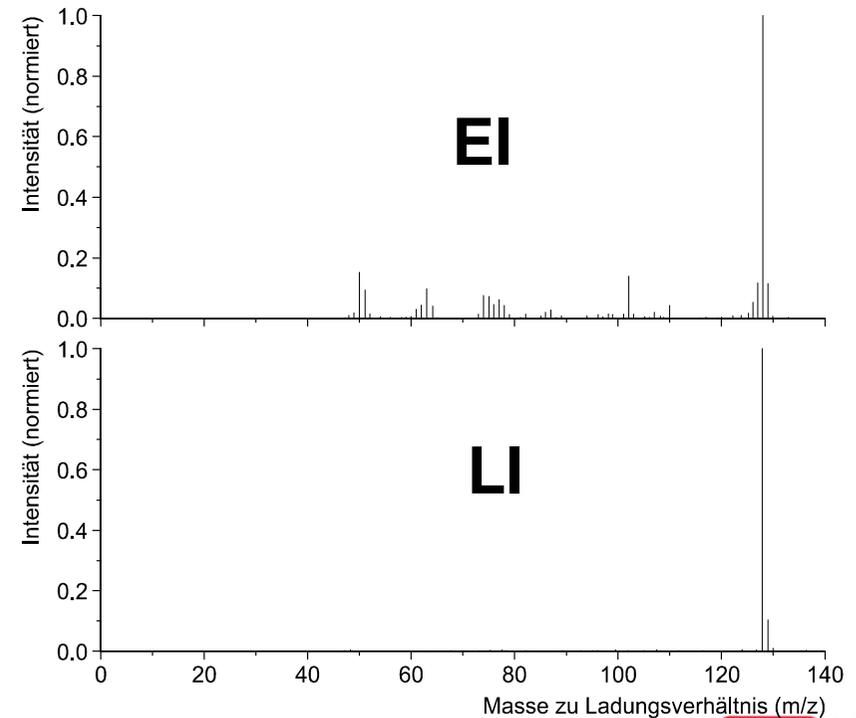

- Acceleration of measurement by shortening GC-separation
- Molecule ion peaks with very little or no fragmentation – „soft“-ionization

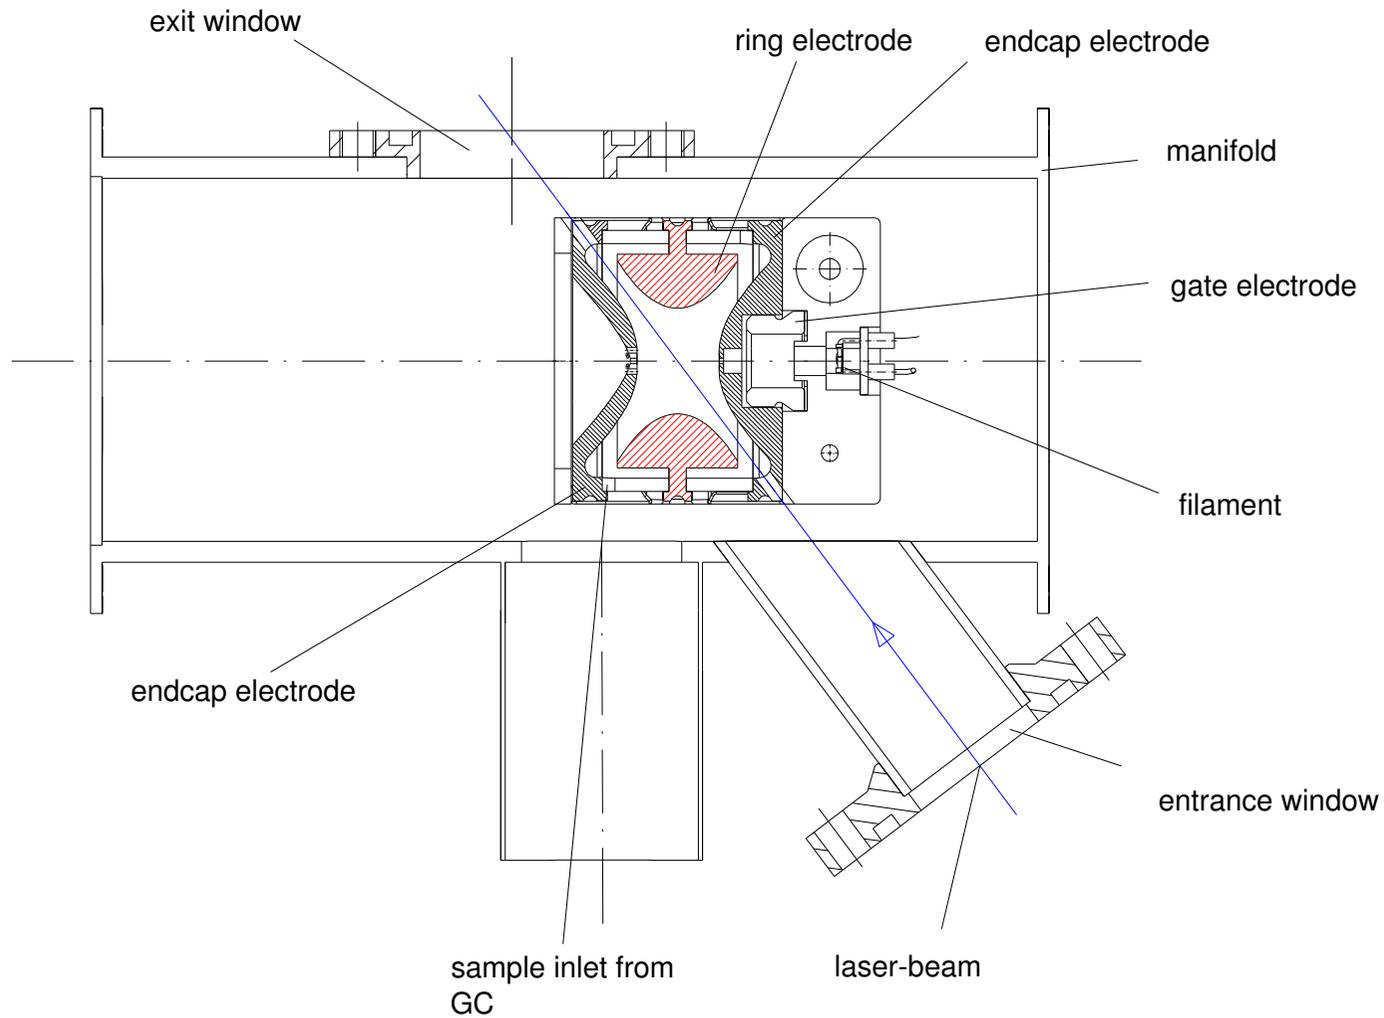

2. Online connection of GC/MS with EI/LI to gasifier

- Real online measurements
- Comparison of EI and LI with real gas

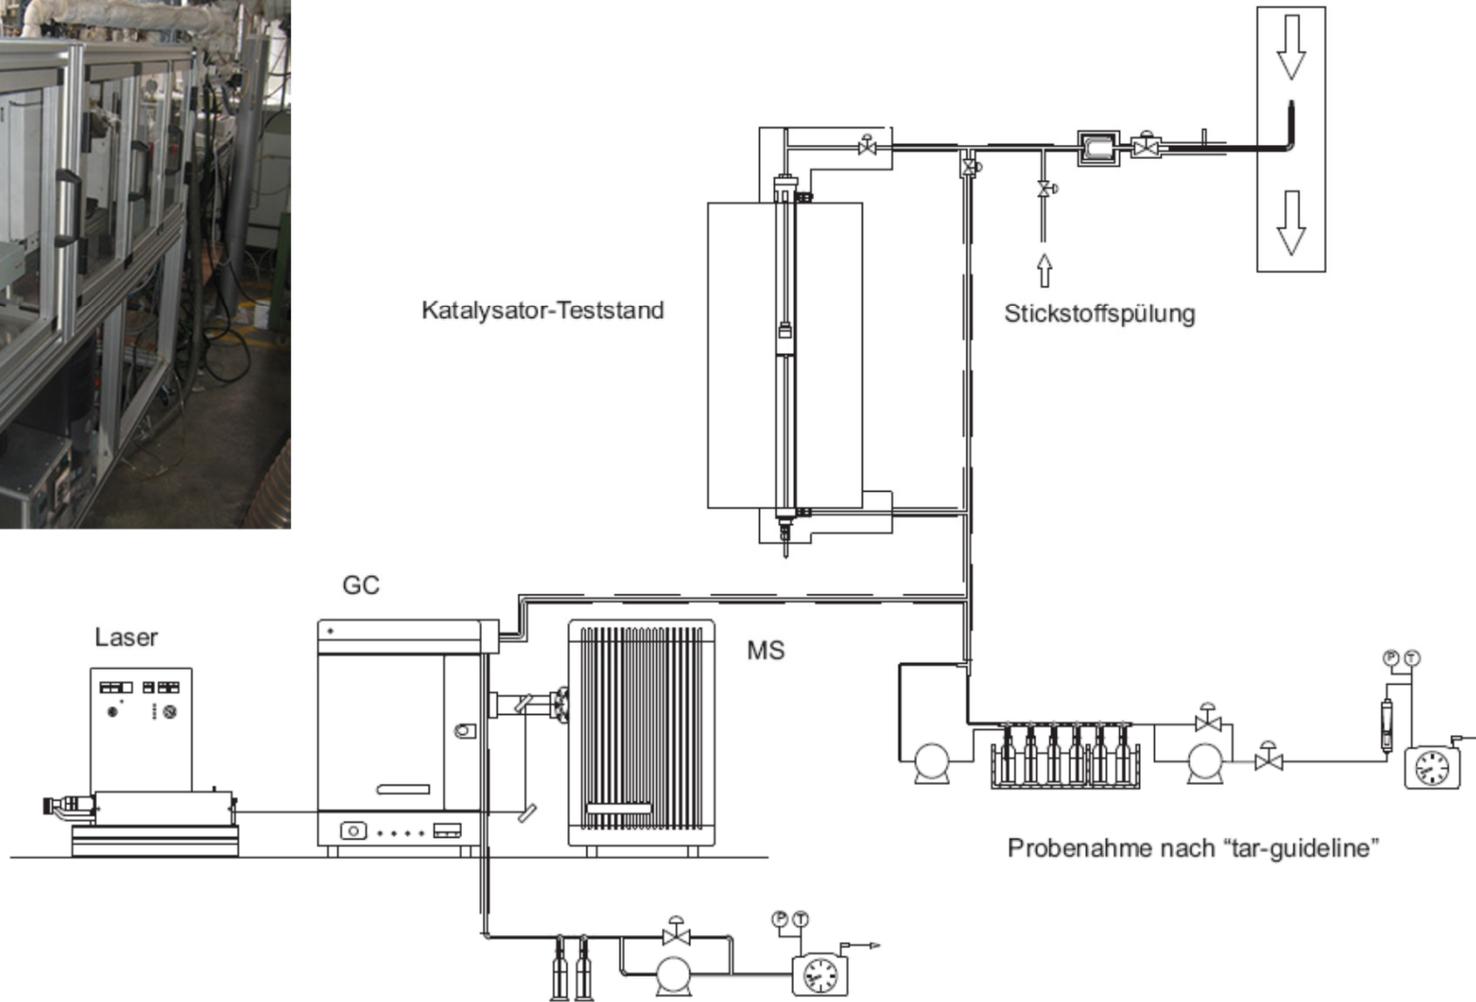

3. „transportable“ system for field measurements

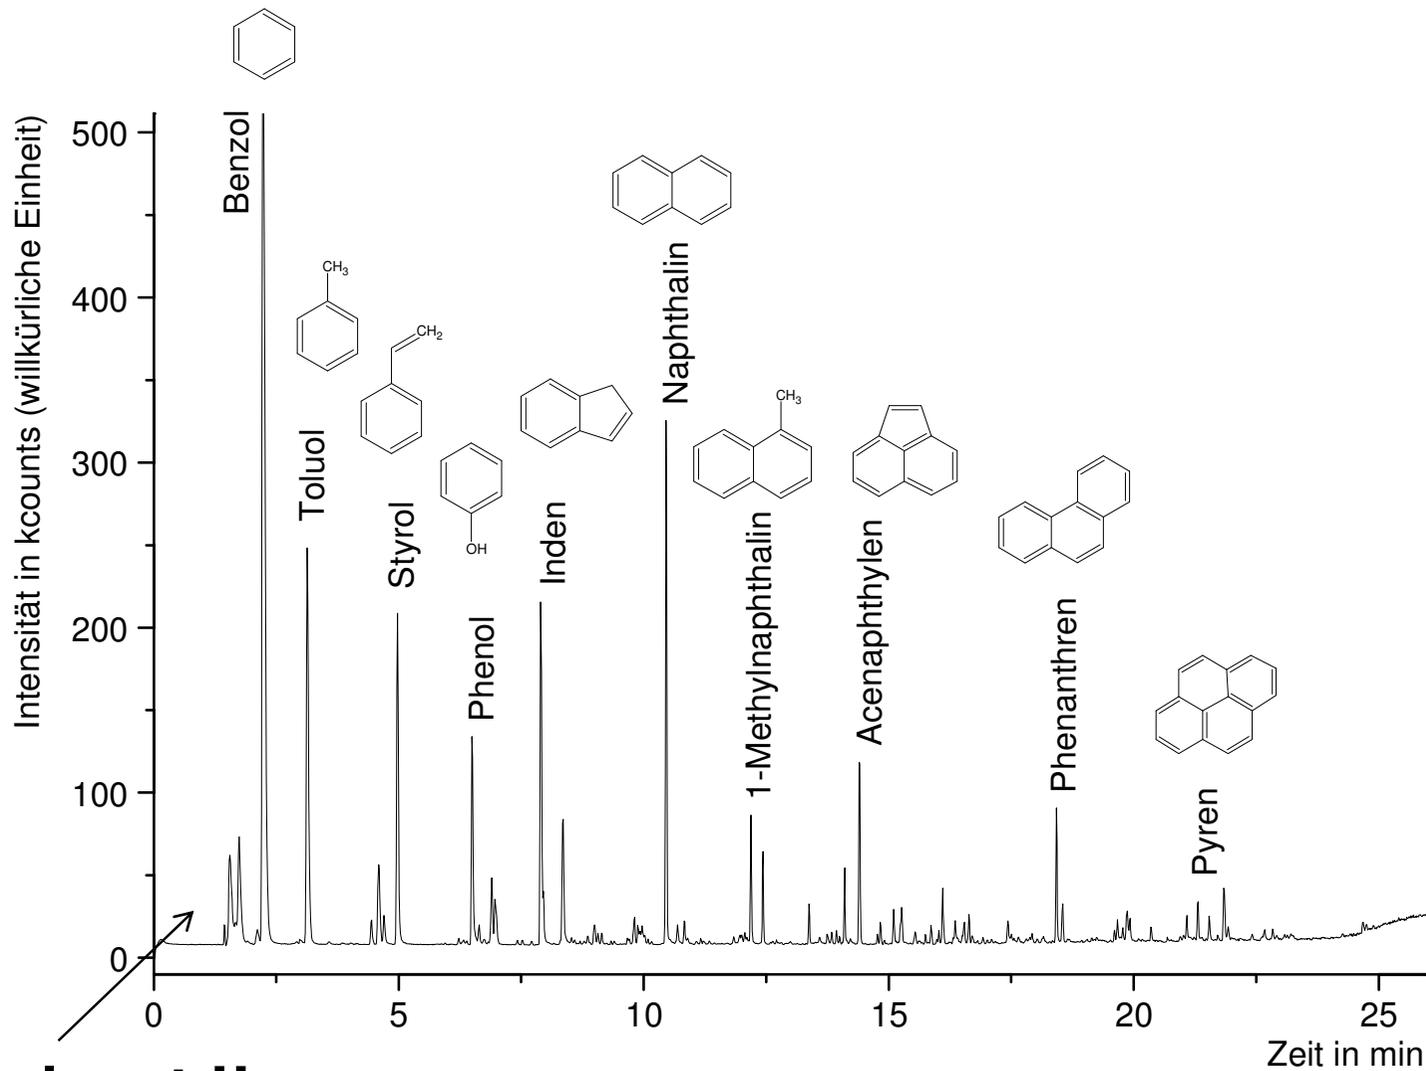

- hard to achieve with this system (it has wheels!)

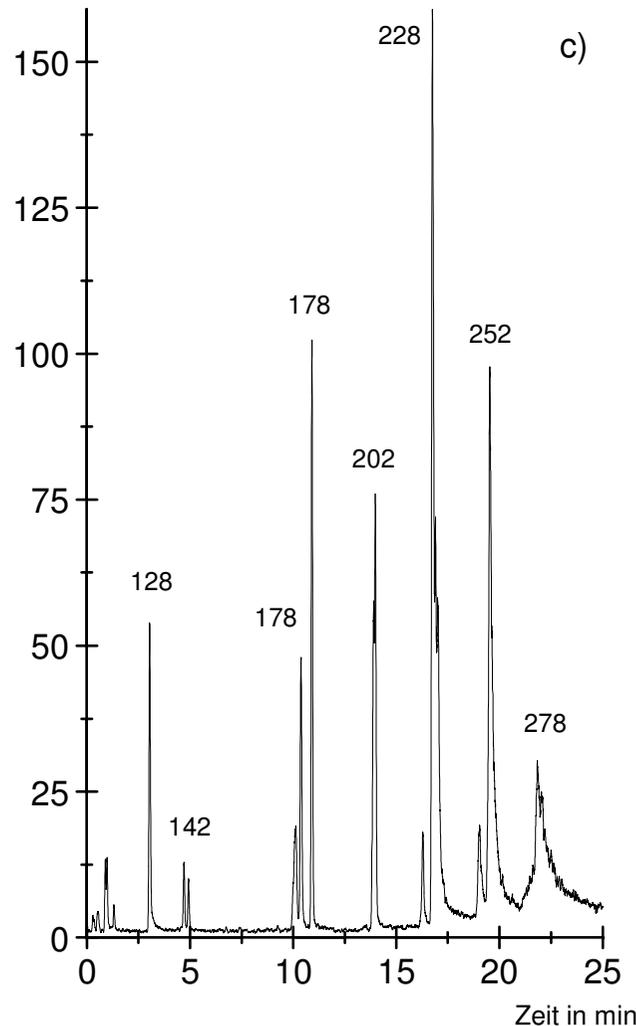

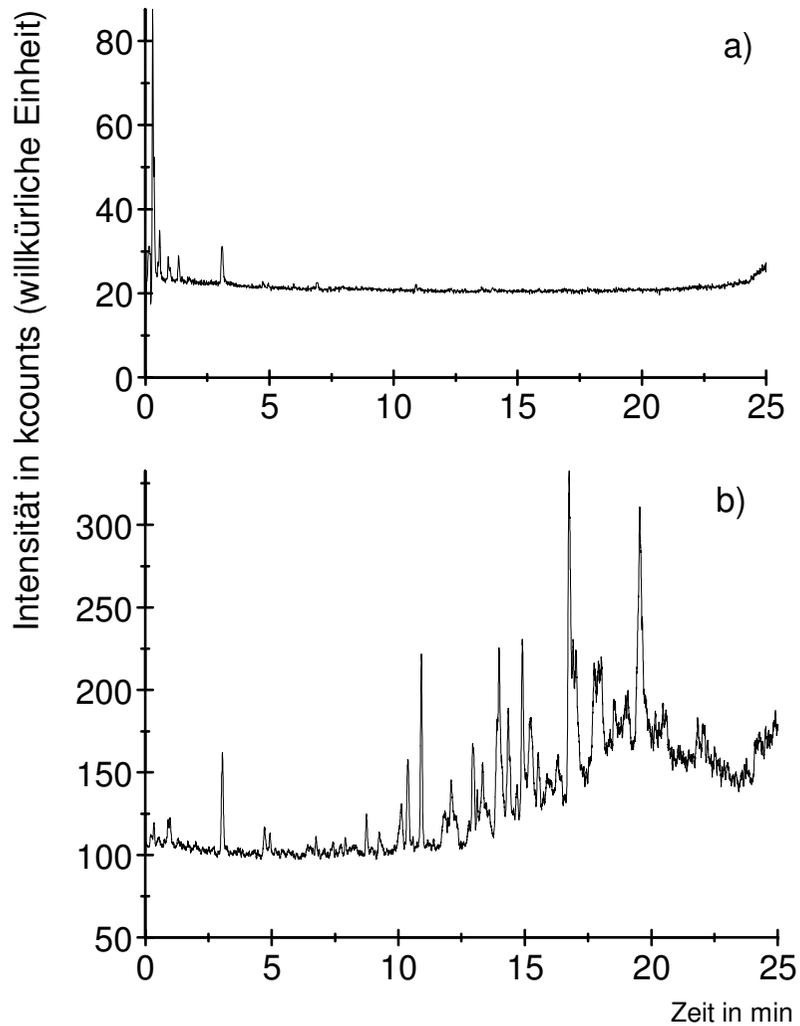

EVUR Online GC/MS with Laser ionization

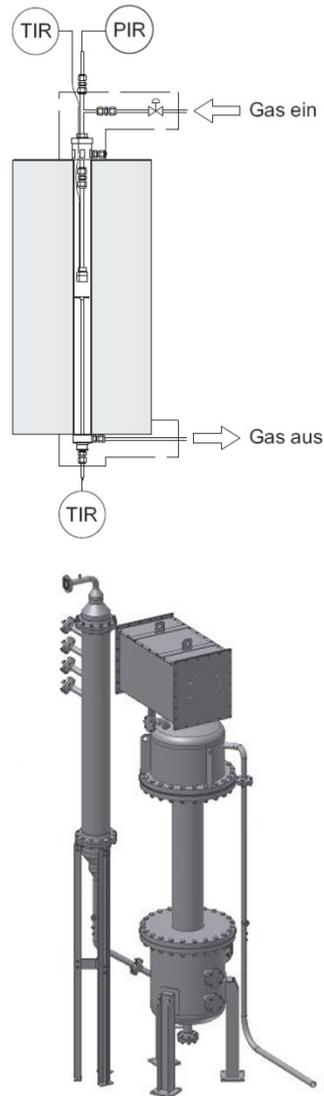

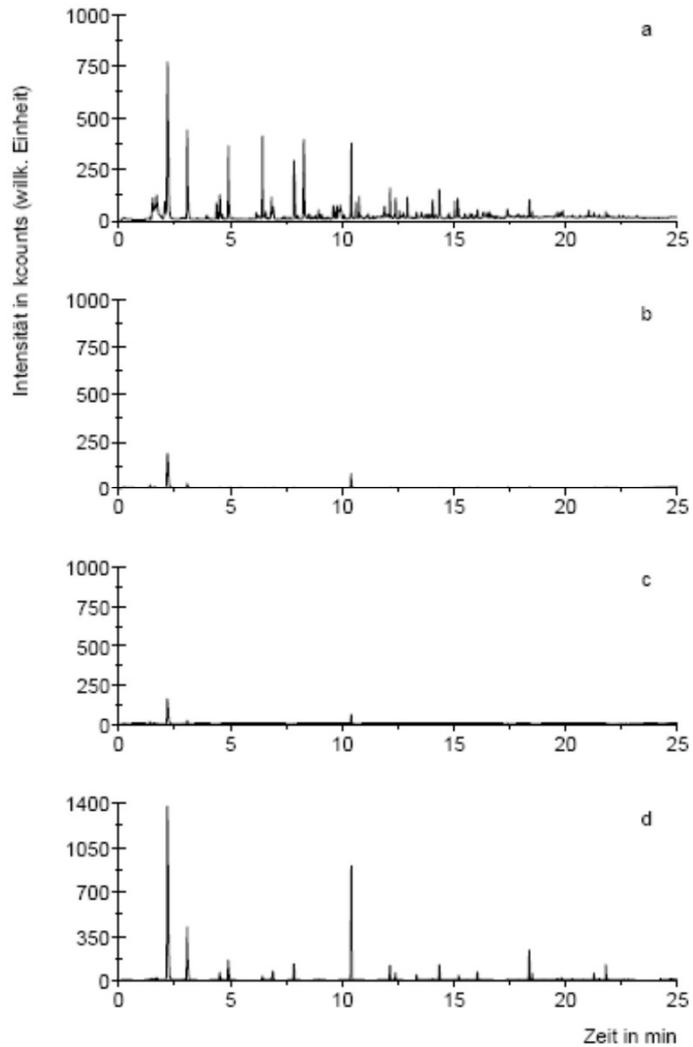

No solvent !!

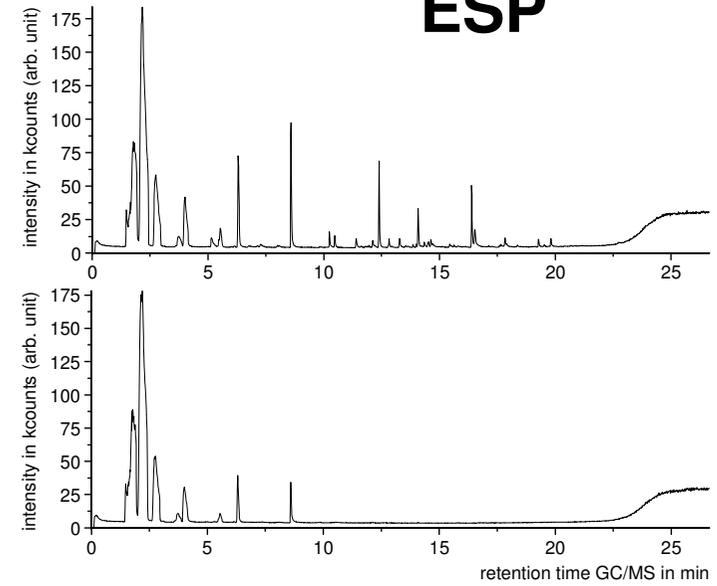

- a) RIC EI
- b) RIC LI
- c) Ion track LI

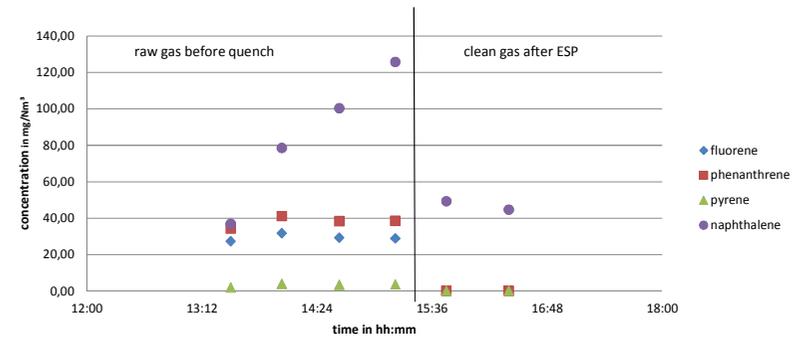

Catalyst behavior

ESP

Concentrations of selected tar species before and after Quench/ESP

1. Current usage

- acquisition of detailed tar composition every 30 minutes; (EI) for complete tar spektrum
- Validation tool for fluorescence measurements
- Online tar analysis for catalyst examination
- Online tar analysis before and after gas cleaning devices

4. Future work (system is at final useable state, Laser could be exchanged)

- Monitoring of selected species with GC / LAMS at higher sampling rate and comparison with CON-TAR
- Comparison to reference methods in more detail
